

EZReader Web Search Application

EZReader can provide a large screen for entering an Internet search term. Once entered the user simply presses ENTER to perform a search at the specified web site. The default browser will open the web site with the search already performed against the entered search term.

The alternative is to open the web page and enter the search term there. However, the text box for entering a search term on most pages is somewhat small and has very little contrast to the surrounding page - making it very hard for a low vision user to locate.

With the EZReader popup entry screen, the user can perform a web site searches much easier!

Entry Screen

Here's an image of the popup search term entry screen in which the user enters the search term.

The ESC key or the ESC button on the popup entry screen can be pressed to cancel the Search.

Pressing the ENTER key will initiate the Search.

The site to be search can be changed by right-clicking on the web site logo. Searches are supported at the following web sites:

- **Google**
- **FaceBook**
- **Amazon**
- **TikTok**
- **X (Twitter)**
- **DuckDuckGo**
- **YouTube**
- **WikiPedia**
